# Search Term Navigation – Suggestions & Samples
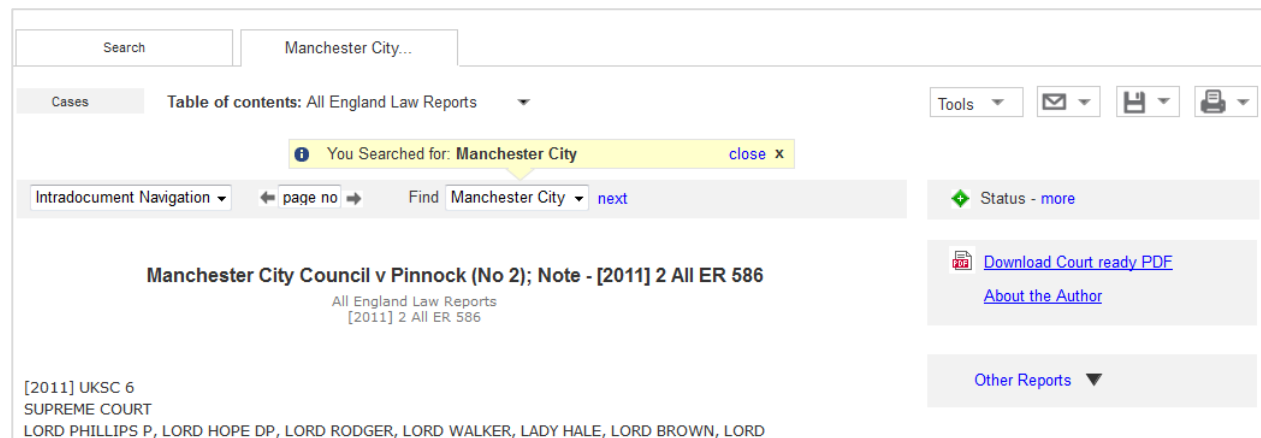

Quite unclear what is required of the user; rethinking search term navigation component for Lexis Advance…

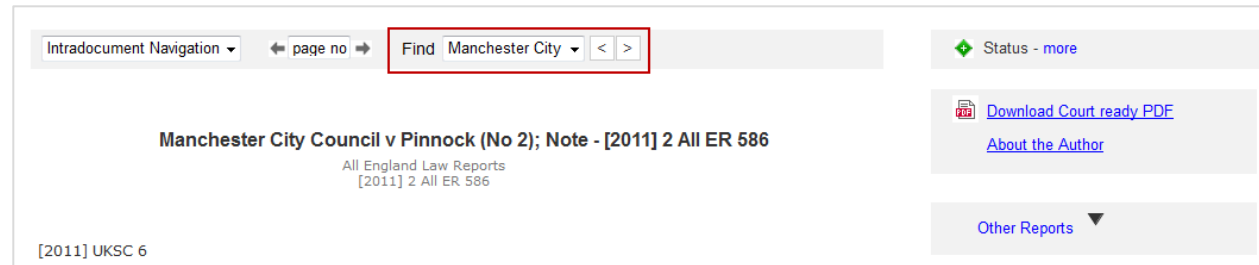

Suggestions

It may help if these components are fixed and the page scrolls to highlight the occurrence.

If you are following up on a search then a tooltip may help in getting attention towards the search component. This can be timer based.

Search Term Navigation – Suggestions & Samples

If we'd rather have arrows then making these arrows look like buttons and placing them together would help as the user is being asked to: read the label (find); select a list item (Manchester City) and then click a next/previous button.

Previous on the first click would just do nothing. We can also start by having one forward arrow and upon going to the first instance we can display previous arrow.

Keeping it simple for the user and only displaying next and previous buttons/links if the user clicks on the FIND button/link.

The focus shifts to the first occurrence and a control box would pop open displaying search term and previous/next buttons.
